

Infertility: A Diabolical Agenda

Analysis by [Dr. Joseph Mercola](#)

✓ Fact Checked

July 09, 2022

STORY AT-A-GLANCE

- › The World Health Organization began working on an anti-fertility vaccine in the 1970s, in response to perceived overpopulation. For 20 years, the WHO's Task Force on Vaccines for Fertility Regulation worked with population control in mind
- › In 1993, the WHO finally announced a birth-control vaccine had successfully been created to help with "family planning." The anti-fertility vaccine uses hCG conjugated (chemically bonded) to tetanus toxoid, used in the tetanus vaccine. As a result, a woman will develop antibodies against both tetanus and hCG
- › HCG is the first signal that tells the woman's body she's pregnant. In response to this signal, her ovaries then produce progesterone, which maintains the pregnancy to term. By combining hCG with tetanus toxoid, it causes this crucial pregnancy hormone to be attacked and destroyed by the woman's own immune system
- › In 1995, the Catholic Women's League of the Philippines won a court order halting a UNICEF tetanus program that was using tetanus vaccine laced with hCG. Three million women between the ages of 12 and 45 had by that time already been vaccinated. Anti-hCG-laced vaccines had also been found in at least four other countries
- › Also in 1995, the Kenyan government launched a WHO tetanus campaign under the guise of eradicating neonatal tetanus. An investigation found the vaccine given to girls and women, aged 15 to 49, contained hCG, and evidence suggests this was an intentional population control agenda

“Infertility: A Diabolical Agenda,” is the fourth vaccine-related documentary by Dr. Andrew Wakefield. It tells the story of an intentional infertility vaccine program conducted on African women, without their knowledge or consent.

While it’s been brushed off as a loony conspiracy theory for years, there’s compelling evidence showing it did, in fact, happen, and there’s nothing to prevent it from happening again.

The Backstory

As explained in the film, the World Health Organization began working on an anti-fertility vaccine, led by Dr. G.P. Talwar in New Delhi, India, in the 1970s, “in response to perceived overpopulation.” For 20 years, the WHO’s Task Force on Vaccines for Fertility Regulation worked with population control in mind.

In 1993, the WHO finally announced a birth-control vaccine had successfully been created to help with “family planning.”¹ The paper trail reveals that by 1976, WHO researchers had successfully conjugated, meaning combined or attached, human chorionic gonadotropin (hCG) onto tetanus toxoid, used in the tetanus vaccine. As a result, when given to a woman, she develops antibodies against both tetanus and hCG.

HCG is a hormone produced by cells surrounding the growing embryo. These hormone-producing cells protect and support embryonic growth and eventually form the placenta.

As explained in the film, hCG is the first signal that tells the woman’s body she’s pregnant. In response to this signal, her ovaries then produce a second hormone, progesterone, which maintains the pregnancy to term.

By combining hCG with tetanus toxoid, it causes this crucial pregnancy hormone to be attacked and destroyed by your immune system, as it’s now misperceived as an invading pathogen. Since hCG is destroyed, progesterone is never produced and, hence, the pregnancy cannot be maintained.

So, if you're already pregnant when taking this witches' brew, it will likely result in a spontaneous abortion, and if you're not already pregnant, you won't be able to get pregnant, as this crucial pregnancy hormone is under constant attack by your immune system. Repeated doses prolong these effects, effectively rendering you sterile.

The WHO Has Been in the Depopulation Business for Decades

As detailed in a Scientific Research paper published in 2017,² "WHO publications show a long-range purpose to reduce population growth in unstable 'less developed countries.'"

In other words, the WHO's longstanding policy has been to support depopulation in third world countries, and they've studied depopulation strategies in India, Bangladesh, Pakistan, Nigeria, Mexico, Indonesia, Brazil, The Philippines, Thailand, Egypt, Turkey, Ethiopia and Colombia for decades.³

While creating an anti-fertility vaccine for those who really don't want children is one thing, using deception to lure girls and young women into taking it is another entirely. As it turns out, the WHO is not above using deception and trickery to shut down fertility in populations they deem unworthy of reproduction.

The Great Deception

The central figures of the film are two Kenyan gynecologists, Drs. Wahome Ngare, and the late Stephen K. Karanja. Both state in the film that infertility is now the biggest gynecological problem in Africa. In recent years, there's been a significant increase in women losing their pregnancies and couples who cannot conceive.

"I have seen the tears. They lose their identity. You die inside," Antoninah Mutinda says. She knows, because she's one of the African women whose fertility has been mysteriously impacted. After her third miscarriage, she was tested and found to have extremely high anti-hCG antibodies. She now suspects the tetanus vaccine she was given may be the culprit.

The anti-fertility vaccine was rolled out in the mid-'90s, but despite support from the Kenyan leadership and "elite groups," it was not popular among Kenyan women, who were concerned about the potential for abuse. They worried it might be disguised as a regular tetanus vaccine program.

Their concerns were valid because, as it turns out, this had already happened. In 1995, the Catholic Women's League of the Philippines won a court order halting a UNICEF tetanus program that was using tetanus vaccine laced with hCG. Three million women between the ages of 12 and 45 had by that time already been vaccinated. Anti-hCG-laced vaccines had also been found in at least four other countries.

Undeterred by bad press, that same year, 1995, the Kenyan government launched a WHO tetanus campaign under the guise of eradicating neonatal tetanus. There were telltale signs that something was wrong, however, because it was already standard practice to vaccinate pregnant women against tetanus. Now, the WHO insisted women who weren't pregnant needed the shot as well, in case they were to become pregnant.

Karanja learned of the deceptive anti-fertility campaigns in other countries during a medical conference in 1995, and became immediately suspicious of the tetanus campaign in his own country. Karanja convinced leaders of the Catholic church – one of the largest health care providers in Kenya – to test the tetanus vaccine being given, to make sure there was no foul play.

Without explanation, the WHO suddenly abandoned the campaign. Alas, 19 years later, in 2013, they were back. All girls and women, 15 to 49 years of age, were instructed to get vaccinated with a series of five injections, six months apart. This, it turns out, is the exact schedule required for the anti-fertility vaccine to produce sterility. Regular tetanus prevention requires only one injection every five to 10 years, and under no circumstance would you need five of them.

Vaccines Test Positive for Anti-hCG

The Catholic Church decided to test the vaccines, and collected three sample vials directly from clinics during the 2014 campaign. The samples were then sent to three independent laboratories for testing. As feared, they found hCG in them. Another six vials were then collected, and tested by six independent labs. This time, half were found to contain hCG.

At this point, the Catholic Church went public, urging girls and women to not comply with the vaccination campaign. In an effort to settle the dispute, an investigative committee was formed, consisting of three representatives selected by the Catholic bishops, and three government officials.

It was agreed that the nine vials already collected would be retested, along with 52 samples from a distributor who sells tetanus vaccine to the Kenyan government. This time, a more precise type of test, high performance liquid chromatography (HPLC), was chosen.

Dr. Nicholas Muraguri, director of medical services for the Kenyan government, contracted agriQ Quest to perform this testing. However, he urged them to test samples provided directly by him rather than the vials previously agreed upon. AgriQ Quest decided to analyze both batches.

The vials that tested positive for hCG using enzyme-linked immunosorbent assay (ELISA), still tested positive using HPLC, but none of the samples provided by Muraguri tested positive.

A Decades' Long Cover-Up

Shockingly, the government then demanded agriQ Quest “alter their report to indicate that they were safe to be administered.” When agriQ Quest refused, the government, the WHO and UNICEF responded by launching a public attack, accusing the Catholic Church of “peddling misinformation.”

And, since the only samples found to contain hCG were those provided by the Church, the government accused them of tampering with the vials in an effort to undermine

confidence in the vaccine.

An added twist here is that the vials that tested positive had the same batch numbers as vials that tested negative. Only later did agriQ Quest discover that these negative vials had fake labels on them. They were not, in fact, from the same lots as those that tested positive. They weren't even made by the same manufacturer.

AgriQ Quest also claims they can prove the positive samples were not tampered with, because they did not test positive for hCG in general. The test clearly shows the hCG was conjugated with tetanus toxoid, and this cannot occur by simply adding hCG to a vial of tetanus vaccine.

The conjugation – the chemical linking or bonding – of hCG to the tetanus toxoid can only occur during the manufacturing process. This is the smoking gun that proves the neonatal tetanus vaccine campaign was a cover for a population control campaign.

Muraguri also lied when he claimed the Kenyan government had only one supplier of tetanus vaccine. As it turns out, there were two. Biological E. Limited provided a regular tetanus vaccine, while the hCG-positive batches came from Serum Institute of India – the same country where most of the WHO's anti-fertility research had been conducted.

“ To imagine there's a system somewhere, that some people somewhere are behind my inability to carry pregnancy to term, that is a diabolical agenda! ~ Antoninah Mutinda ”

Both Ngare and Karanja paid a steep price for their vigilance. The medical board called them for disciplinary action. Karanja was issued a gag order, and since 2014 was not allowed to speak publicly about vaccines in Kenya. He broke that gag order for this film. April 29, 2021, Karanja died, allegedly from COVID infection.

A Truly Diabolical Agenda

Speaking for millions of women just like her, Mutinda, who has now struggled with infertility for years, says:

“To imagine there’s a system somewhere, that some people somewhere are behind my inability to carry pregnancy to term, that is a diabolical agenda!”

Before his untimely death, Karanja shared a message with the world, through the makers of this film:

“When they are through with Africa, they’re coming for you.”
